

WHY BIOLOGY

Stop fertilizing. Start feeding the web.

Dr. Elaine Ingham at the microscope.

Plants don't feed alone.

Bacteria and fungi produce enzymes that break down minerals and organic matter and free the nutrients they contain. When protozoa and nematodes consume those bacteria and fungi, the surplus is released right at the root, in plant-available form.

Bacteria produce glues that bind soil particles into microaggregates; fungal hyphae weave those into larger macroaggregates. The result behaves like a sponge, holding water, letting air flow in and resisting erosion.

A surface already inhabited leaves little room for invaders. It works as nature's integrated pest management, and it costs nothing once it is built.

OUR STORY

Dr. Elaine Ingham mapped the Soil Food Web and taught the world to restore it. The Soil Food Web Foundation, established in October 2025, carries her work forward with growers on working land.

Watch a free webinar

A live hour with an instructor or a practitioner, every month. The easiest first step.

COMMUNITY

Join a global community of Soil Regenerators.

A workshop group around a finished compost pile.

Your food is only as nutritious as your soil is alive.

Farmers, consultants, gardeners and people who care where their food comes from all have a place here. It's easy to find your place in this movement. Reach out to discover opportunities to join us as a student, volunteer, ambassador, donor and partner. As a nonprofit, the best way to support us is to share our message and resources with people who need them.

Join the free online community

Meet other people in the regenerative agricultural space. Get your questions answered by other practitioners of the Soil Food Web Approach who share the desire to restore the world's soils.

Soil Food Web Foundation

A 501(c)(3) nonprofit

Grow your own biology.

The soil beneath our farms and forests is alive.

A web of bacteria, fungi, protozoa, nematodes and microarthropods feeds plants, builds soil, stores carbon and cleans water *when it is intact*.

We train farmers, and the people who work with them, to transition from chemical inputs to biology. You'll learn to test your soil, produce your own BioComplete™ compost and liquid amendments, and rebalance the microbial content of your fields.
