

OUR STORY

It began with one scientist looking closer.

Dr. Elaine Ingham at the microscope.

Dr. Elaine Ingham pioneered research in soil biology across forty-five years and made her science radically accessible, so that anyone anywhere could learn to restore the soil beneath their feet.

She founded this work; the Foundation was created in 2025 to carry it forward. She passed in February 2026, and the work she started continues through the Foundation, the school inside it, and practitioners in more than 132 countries who bring the same close attention to their own soil.

She taught at Oregon State from 1986 to 2002, served as the first President of the Soil Ecology Society, and co-authored the USDA's Soil Biology Primer.

Her published record, in full:

WHY THIS MATTERS FOR CLIMATE

Plants pull carbon from the air and invest much of it in the soil, where it is built into microbial bodies, aggregates and long-lived fungal networks. Biological management also avoids emissions: less fertilizer manufactured and moved, fewer passes over the field.

RESEARCH

The science is real, and we are opening it to the world.

Soil samples beside the microscope.

Forty-five years of soil biology research, practiced by graduates in more than 132 countries on six continents.

What the biology does when it is intact

NUTRIENT CYCLING

SOIL STRUCTURE

WEED PRESSURE

PESTS AND DISEASE

Testate amoeba, 40x objective. Photograph: Joy Kaluf. A count names what is there: bacteria, fungi, protozoa, nematodes and micro-arthropods.

What we test before we recommend

Measurable. Every recommendation starts with a count, not a guess.

Diagnostic first. We look at your soil before we suggest anything.

Compatible. No need to tear up what you have.

Each mechanism we teach is established soil biology. How much of any one benefit a field sees depends on climate, crop, starting condition and management. We publish results by site, with the person and the year, and say what one site cannot prove.

Dr. Ingham's publications, item by item, on our publications page:
soilfoodweb.com/publications

PRACTICE

It works on real land, in the hands of real growers.

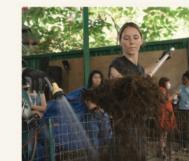

Agroecology plots at Rancho Cacachilas.

The biology is universal; the practice is local. Every number we publish carries a name, a place, a year.

Nick Padwick farms four thousand acres in Norfolk, England. Roberto Silva works a hundred and forty in Piura, Peru. Jenn Sirp grows on a quarter acre in California. They film the work themselves and publish what changed, so nobody has to take our word for it.

The scale runs from that quarter acre to ten thousand acres of corn and soy in Illinois, and a public park on Governors Island in New York. The method does not change with the acreage. Assess the biology under a microscope, make the amendment that is missing, apply it, and count again.

We partner with growers to trial the approach where they farm, and to document what happens when they do.

Find a trained professional near you

Consultants and lab technicians who finished the assessed programs are listed in our own directory.

Watch the case studies

Growers filming their own ground, crop by crop and climate by climate. Start with one that looks like yours.
