

RESEARCH

The science is real, and we are opening it to the world.

Soil samples beside the microscope.

Four decades of soil biology research, practiced by graduates in more than 100 countries on six continents.

What the biology does when it is intact

What we test before we recommend

Measurable. Every recommendation starts with a count, not a guess.

Diagnostic first. We look at your soil before we suggest anything.

Compatible. No need to tear up what you have.

Each mechanism we teach is established soil biology. How much of any one benefit a field sees depends on climate, crop, starting condition and management. We publish results by site, with the person and the year, and say what one site cannot prove.

Testate amoeba, 40x objective. Photograph: Joy Kaluf. A count names what is there: bacteria, fungi, protozoa, nematodes and micro-arthropods.

PRACTICE

It works on real land, in the hands of real growers.

Agroecology plots at Rancho Cacachilas.

The biology is universal; the practice is local. Every number we publish carries a name, a place and a year.

Nick Padwick farms four thousand acres in Norfolk, England. Roberto Silva works a hundred and forty in Piura, Peru. Jenn Sirp grows on a quarter acre in California. Eleven of them have filmed their own work and published it: where they started, what they changed, and what was measured after, at length and in their own words.

The scale runs from that quarter acre to ten thousand acres of corn and soy in Illinois, and a public park on Governors Island in New York. The method does not change with the acreage. Assess the biology under a microscope, make the amendment that is missing, apply it, and count again.

Harrington's Organic Land Care, York Farms, Illinois.

Find a trained professional near you

Consultants and lab technicians who finished the assessed programs are listed in the Foundation's own directory.

Watch the case studies

Eleven films. Each pairs a grower's story with the data behind it: where they started, what they practiced, and what was measured.

COMMUNITY

A global community makes this work outlast any one of us.

A workshop group around a finished compost pile.

Join the free community

Where farmers, gardeners and soil scientists connect and learn. Open to anyone, at no cost.

sfw.one/brochure-community

Dr. Ingham built the method to be handed on. It depends on no one person: a microscope, counts anyone can learn to read, and people trained to read them. Soil Regenerators on six continents teach it and publish what they find. That is what outlasts any one of us, and every role in it is open.
